Student 2	Name: Taipaw Mro ID: 242173 AUW Email: auw242173@auw.edu.bd
Student 3	Name: Saindau Chowdhury ID: 252143 AUW Email: auw252143@auw.edu.bd

Course: ICP | Submission Date: 13.08.2026

1. Abstract

TasteTrail is a responsive food recipe website designed to give users a simple, attractive, and organized way to explore recipes and food categories. The project combines HTML for the webpage structure, CSS for visual design and responsive layouts, and JavaScript for interactive client-side features. The interface includes a navigation bar, homepage hero section, recipe cards, search and filtering areas, categories, favorites, an about section, a contact form, dark-mode styling, and a responsive footer. The main purpose of the project was to demonstrate practical front-end development skills while creating a user-friendly recipe website.

2. Introduction

Food websites are useful platforms for discovering cooking ideas and organizing recipes in an easy-to-browse format. For this project, TasteTrail was developed as a front-end website that focuses on clear navigation, attractive presentation, responsive design, and basic user interaction.

The main objectives were to:

- ❖ Create a structured recipe website using HTML.
- ❖ Design a clean and responsive interface using CSS.
- ❖ Use JavaScript to add interactive website behavior.
- ❖ Organize recipes and categories so users can browse them easily.
- ❖ Make the layout adaptable to desktop, tablet, and mobile screens.

3. Methodology

The website was developed as a front-end project using three main technologies: HTML, CSS, and JavaScript. The HTML layer provides the content and page structure. The CSS layer controls the layout, typography, spacing, colors, cards, buttons, images, dark mode, and responsive behavior. JavaScript is used to connect user actions with interactive website behavior.

3.1 HTML Implementation

The HTML structure organizes the website into navigation, homepage/hero content, recipe sections, category areas, favorites, about content, contact form, and footer. These sections allow the site to behave like a small multi-section recipe platform while remaining a front-end application.

3.2 CSS Implementation

CSS was used to create the visual identity of TasteTrail. Grid and flexbox layouts organize the content, while hover effects improve card and button interaction. Media queries change the layout for smaller screens. The stylesheet also contains a dark theme and responsive rules for recipe grids, categories, navigation, and images.

3.3 JavaScript Implementation

JavaScript provides the interactive behavior of the website, including page/navigation interaction, recipe search or filtering, category interaction, form handling, and other client-side controls. These features make the website more interactive than a static HTML page.

Code Evidence – CSS

The CSS implementation includes sticky navigation, recipe grids, cards, dark-mode styling, and mobile media queries. The supplied stylesheet defines responsive breakpoints at 850px and 600px.

4. Output

The completed TasteTrail website provides a visually organized recipe-browsing experience. The supplied styling demonstrates a sticky navigation bar, a large hero section, recipe cards, category layouts, favorites and contact sections, a footer, dark-mode styling, and responsive behavior for smaller screens.

- Responsive homepage and hero section.
- Navigation system for the main website sections.
- Recipe cards with images, descriptions, and interaction styling.
- Search and filtering interface for recipes.

- Recipe category section.
- Favorites section.
- About and contact sections.
- Contact form with a feedback/message area.
- Dark-mode visual theme.
- Responsive layout for tablet and mobile screen sizes.

Visuals to insert before submission:

- Screenshot 1: Full homepage/hero output.
- Screenshot 2: Recipe cards and category/filter area.
- Screenshot 3: Mobile or responsive output.
- Screenshot 4: A code screenshot showing HTML/CSS/JavaScript.

5. Challenges and Limitations

Several challenges can occur when developing a responsive recipe website. Maintaining the same visual structure across different screen sizes requires careful use of CSS grids, flexbox, and media queries. Organizing many recipe cards and categories also requires a clear layout so that the page does not become difficult to navigate. Interactive search, filtering, forms, and theme controls require careful JavaScript event handling.

- Keeping the layout consistent on desktop, tablet, and mobile screens.
- Organizing recipe cards and categories clearly.
- Maintaining readable navigation on smaller screens.
- Connecting search/filter controls with recipe content.
- Handling user input in forms.

- The project is primarily a front-end implementation and does not include a real database or server-side recipe management system.
- Image resources may require an internet connection when external image URLs are used.

6. Conclusion and Discussion

The TasteTrail project demonstrates how HTML, CSS, and JavaScript can be combined to create a modern and responsive food recipe website. The project brings together structured webpage content, visual design, responsive layouts, recipe organization, and interactive client-side features. Developing the website also strengthened practical understanding of HTML structure, CSS layout techniques, responsive design, and JavaScript-based interaction.

7. Future Work

TasteTrail can be extended from a front-end project into a more complete recipe platform. Future development could add:

- A backend and database for storing recipes.
- Separate detailed pages for each recipe.
- User registration and login.
- A permanent favorites system using user accounts.
- Recipe ratings and comments.
- A real newsletter/email subscription service.
- Advanced recipe search connected to a database.
- Improved accessibility and image optimization.
- An admin panel for managing recipes.

9. Individual Contributions

Replace the placeholders below with the actual names and responsibilities of the group members. If the project was completed individually, combine the responsibilities under one student's name.

Student 1 – [Parthakim Bawm]: Planned the overall website structure and developed the main HTML content and navigation.

Student 2 – [Taipaw Mro]: Designed the website using CSS, including layouts, recipe cards, buttons, responsive rules, and visual styling.

Student 3 – [Saindau Chowdhury]: Implemented JavaScript functionality such as navigation interaction, recipe search/filtering, forms, and other client-side behavior.

Finalization (joined): The three members jointly tested the website, corrected issues, prepared screenshots, and finalized the project report.
